

RatDoor™ Explosive Frame

The innovative TD8448EF RatDoor™ Explosive Frame is a training tool that allows for a variety of standard size wood and metal doors to be inserted for use in explosive breaching training. The system will accept up to a 39" wide and 83" tall standard door; in either a pre-hung, or stand alone configuration. The frame is 87.5" tall x 49.5" wide. The replaceable wooden mounting points allow for rapid replacement of consumables. This helps facilitate low reset times. The Ratdoor™ Explosive Frame is designed and built in the United States using high quality materials to ensure durability despite consistent use. Each door is powder coated to ensure long term aesthetic and functional use. The RatDoor Explosive Frame is available in two configurations. The "BI" version allows for easy installation into a fixed training environment. The "FS" version is freestanding and can be easily disassembled, transported, and setup in different locations.
